Non surgical root canal therapy has become a routine procedure in modern dentistry. Technical and scientific advances in endodontics have resulted in the retention of millions of teeth that would otherwise be lost. Unfortunately, not all treatments result in optimum long term healing. Compromised outcome of endodontic treatment can be due to narrow or curved canals which were not treated during the initial phase. Complicated canal anatomy went undetected in the first procedure. Post endodontic restoration were delayed following the endodontic treatment. If a clinician wishes to approach treating these teeth, they should have the appropriate armamentarium and be capable of performing these specialized techniques routinely. This CDE programme will provide the participants comprehensive training regarding treatment planning of non surgical retreatment, coronal disassembly, techniques of removing root canal filling materials, separated instruments and management of canal impediments. This shall increase the core competence of participants in management of such cases.

### **Benefits of Attending this Programme:**

- How to avoid instrument separation in canal
- Identify canal curvatures
- Protocol to be followed in instrument retrieval
- Different techniques of crown and post removal
- Management of iatrogenic errors
