REGISTER
2019-2020

HEPATITIS B VACCINE (rDNA) I.P.

GeneVac-B® Thiomersal Free

(0.1, 0.6 dose)

DESCRIPTION
GeneVac-B (Hepatitis B Vaccine (rDNA) I.P.) is a non infectious recombinant DNA Hepatitis B Vaccine. It contains purified surface antigen of the virus obtained by culturing genetically-engineered *Hansenula polymorpha* yeast cells having the surface antigen gene of the Hepatitis B virus. The Hepatitis B surface antigen (HBsAg) expressed in the cells of *Hansenula polymorpha* is purified through several chemical steps and formulated as a suspension of the antigen adsorbed on aluminium hydroxide. The vaccine does not contain any material of human or animal origin.

COMPOSITION

Paediatric
Each dose of 0.5 ml contains :-
10 mcg of purified Hepatitis B surface antigen
Adsorbed on Aluminium hydroxide (Al⁺⁺⁺) 0.25 mg to 0.40 mg
Produced in *Hansenula polymorpha* (yeast)
Dose : 0.5 ml by intramuscular injection

Adult
Each dose of 1 ml contains :-
20 mcg of purified Hepatitis B surface antigen
Adsorbed on Aluminium hydroxide (Al⁺⁺⁺) 0.50 mg to 0.80 mg
Produced in *Hansenula polymorpha* (yeast)
Dose : 1 ml by intramuscular injection

INDICATIONS
GeneVac-B is indicated for active immunisation against Hepatitis B infection in subjects considered at risk of exposure to HBV-positive material.
Immunisation against hepatitis B is expected in the long term to reduce not only the incidence of this disease, but also its chronic complications such as chronic active hepatitis B and hepatitis B associated cirrhosis and primary hepatocellular carcinoma.
In areas of low prevalence of hepatitis B, immunisation with GeneVac-B is recommended for neonates/infants and adolescents as well as for subjects who are, or will be, at increased risk of infection such as:
◆ Health Care Personnel.
◆ Patients receiving frequent blood products.
◆ Personnel and residents of institution.
◆ Persons at increased risk due to their sexual behavior.
◆ Illicit users of addictive injectable drugs.
◆ Travellers to areas with a high endemicity of HBV.
◆ Infants born of mothers who are HBV carriers.
◆ Persons originating from areas with a high endemicity of HBV.
◆ Others: Police personnel, fire brigade personnel, armed forces personnel and anybody who through their work or personal lifestyle may be exposed to HBV.
◆ Household contacts of any of the above groups and of patients with acute or chronic HBV infection.
In areas of intermediate or high prevalence of hepatitis B, with most of the population at risk of acquiring the disease, immunisation should be offered to all neonates and young children. Immunisation should also be considered for adolescents and young adults.
The vaccine can be safely and effectively given simultaneously but at different injection site with DTP, DT, TT, BCG, Polio vaccine (OPV and IPV), yellow fever vaccine, *Haemophilus influenzae* type b and vitamin A supplementation.

CONTRAINDICATIONS
GeneVac-B should not be administered to subjects with known hypersensitivity to any component of the vaccine, or to subjects having shown signs of hypersensitivity after previous Hepatitis B Vaccine administration.

WARNINGS AND PRECAUTIONS.
Because of the period of latency of hepatitis B infection it is possible for unrecognised infection to be present at the time of immunisation. The vaccine may not prevent hepatitis B infection in such cases.
The vaccine will not prevent infection caused by other agents such as hepatitis A, hepatitis C and hepatitis E and other pathogens known to infect the liver.
The immune response to Hepatitis B vaccines is related to age. In general, people over 40 years of age respond less well.
In haemodialysis patients and persons with an impaired immune system, adequate anti-HBs antibody titres may not be obtained after the primary immunisation course and such patients may therefore require administration of additional doses of vaccine (see Dosage recommendation for immunocompromised persons)
As with all injectable vaccines, appropriate medication (e.g. adrenaline) should always be readily available for treatment in case of rare anaphylactic reactions following the administration of the vaccine.
ADRENALINE INJECTION (1:1000) MUST BE IMMEDIATELY AVAILABLE SHOULD AN ACUTE ANAPHYLACTIC REACTION OCCUR DUE TO ANY COMPONENT OF THE VACCINE. For treatment of severe anaphylaxis the initial dose of adrenaline is 0.1-0.5 mg (0.1-0.5 ml of 1:1000 injection) given s/c or i/m. Single dose should not exceed 1 mg (1 ml). For infants and children the recommended dose of adrenaline is 0.01 mg/kg
